### MR RT WRIST 19-APR-2010:

Multiple sequences were performed in sagittal, axial and coronal sections including stir sequences. Increased signal noted in the bone marrow of the right scaphoid, right lunate and right capitate bones in keeping with bone marrow oedema and likely due to bone bruise. Some separation noted between the scaphoid and lunate bones with small amount of fluid seen between the two bones appearances likely in relation to be mild scaphoid lunate dissociation. Some joint effusion noted in the lateral aspect of the right wrist. No marked signal changes noted in the distal radius or ulna. Normal appearance of the TFCC. Normal appearance of the tendons surrounding the right wrist.
